

Visual Estimates

With the Lower Pubnico windfarm in the nearby area, you may already be familiar with large scale wind energy and the way it looks on the land. Even still, it can be difficult to imagine how a turbine will appear in your community. The following images will help give a sense of scale to this project. These are preliminary models depicting the turbine from what is estimated to be the most visible viewpoints.

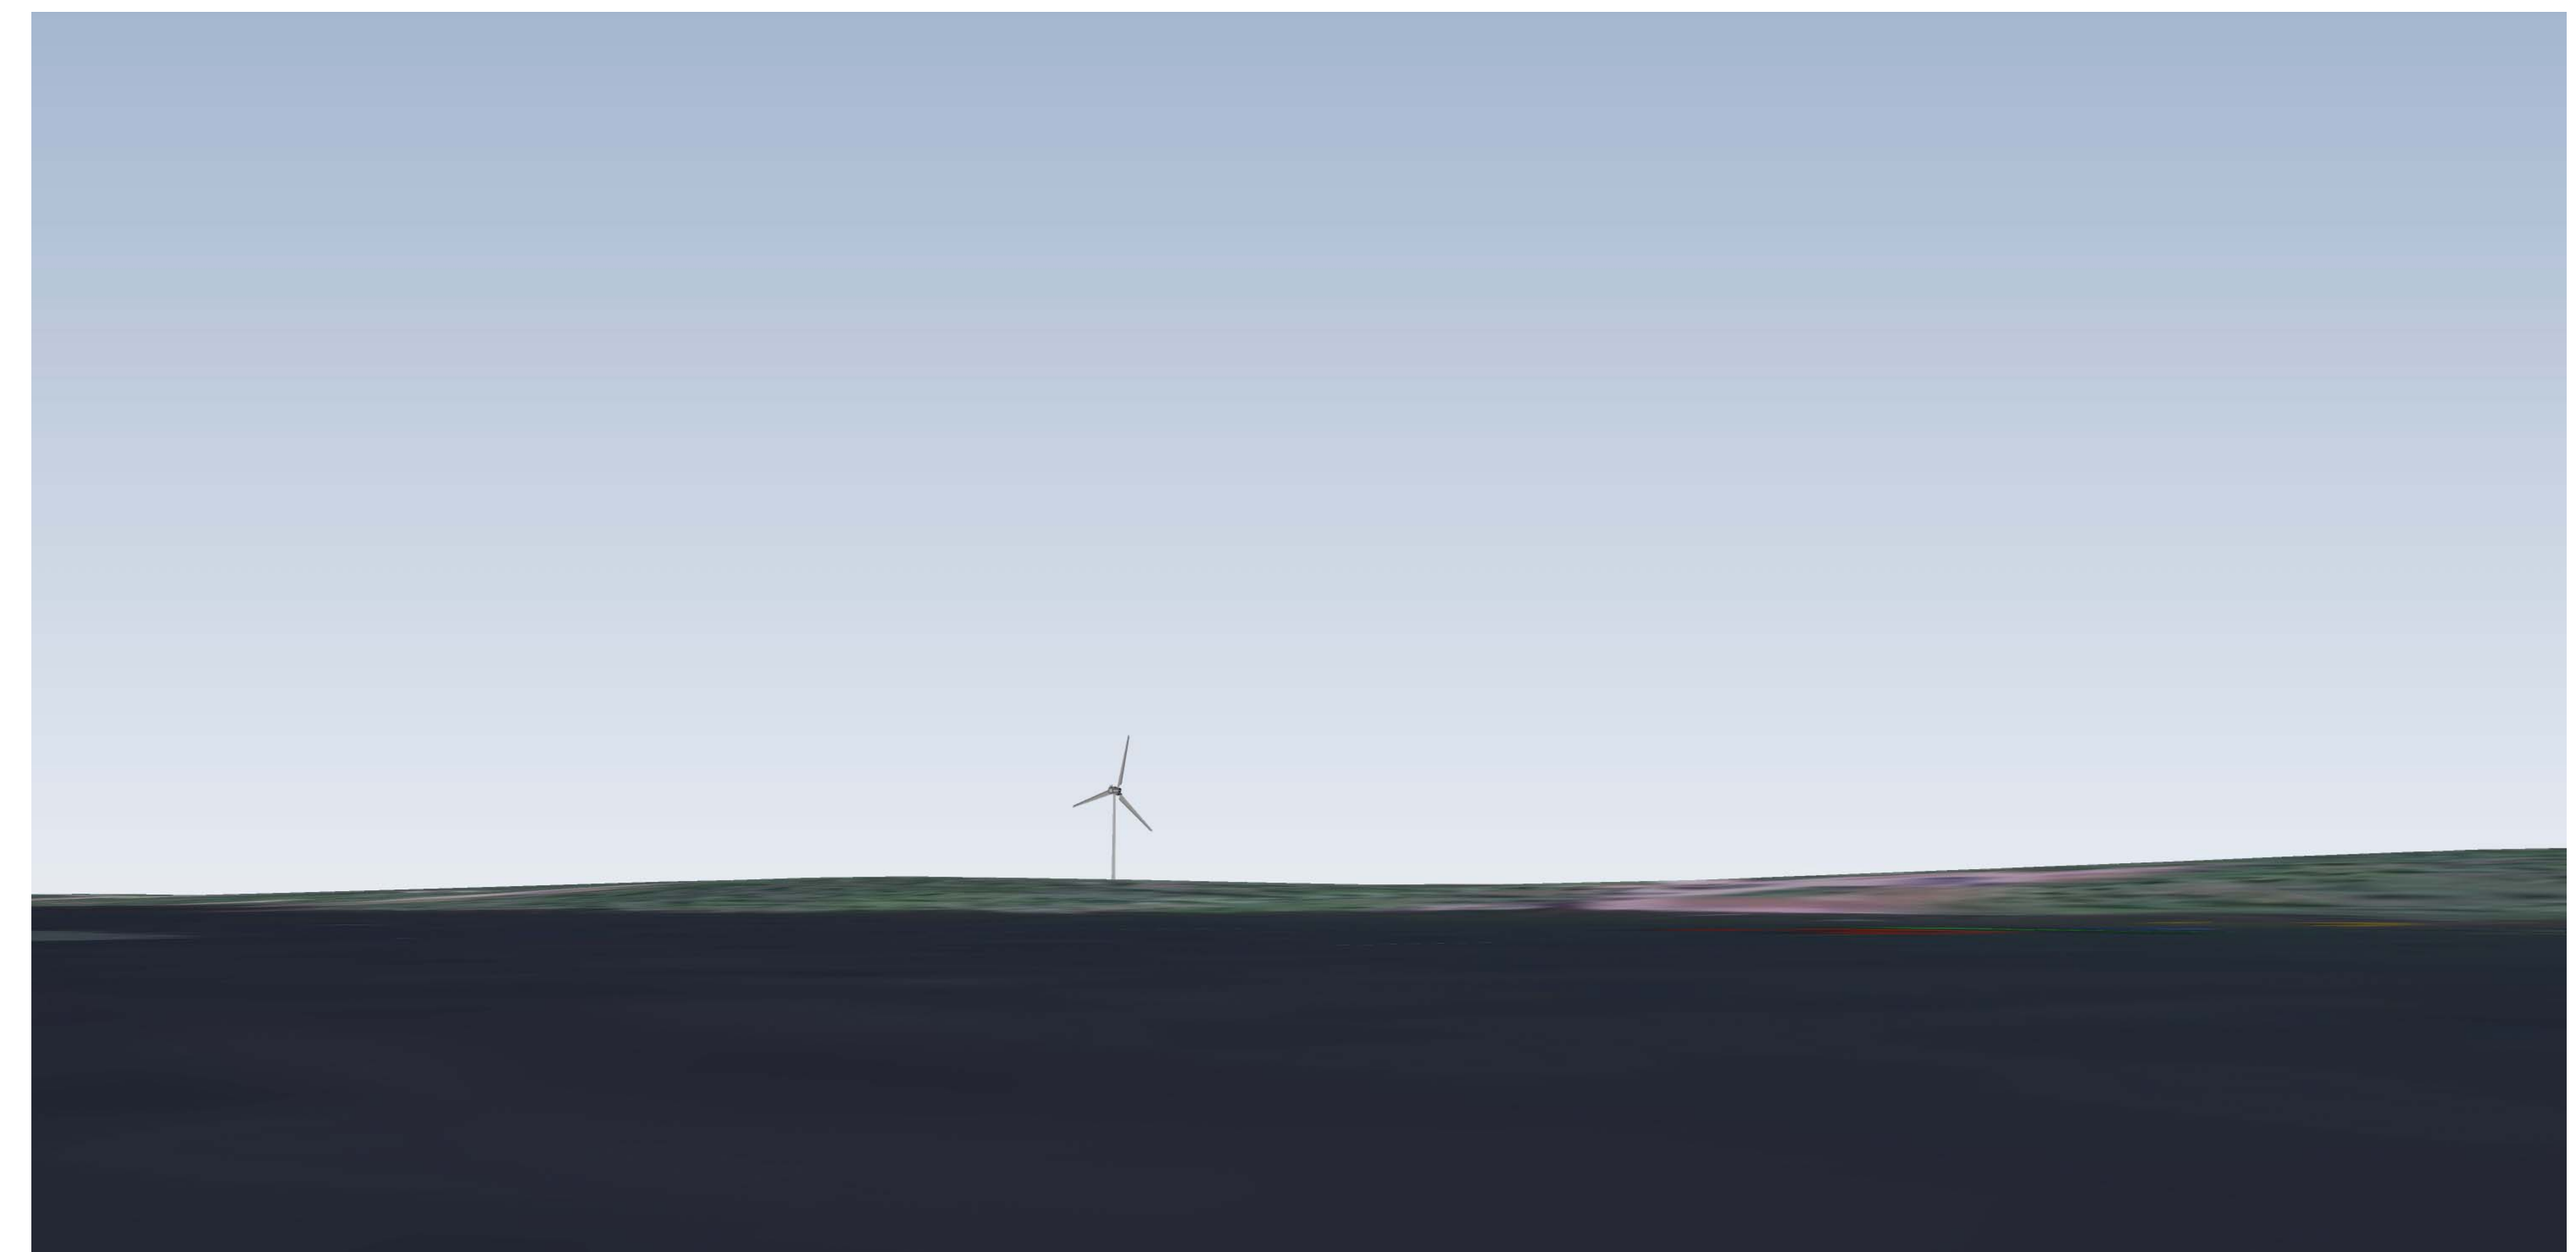

The local topography is very flat, which means the turbine will not be peached high above the surrounding area as is common to wind energy development. Because of this, the presence of trees at the point of observation, which is not represented in the model, will have a dramatic effect on visibility. As much of this area enjoys healthy tree cover, we expect the turbine to be substantially obscured.
